

Component outputs are ranking scores, not risks, in the model's own benchmark as well as in MIMIC-IV

External validation and recalibration of EchoNext-Mini in MIMIC-IV · 45,878 patients

Study

- 1 45,878 patients
one 12-lead ECG each
- 2 Echocardiography
reference within 1 year
- 3 Released model
applied without retraining

47.2%

had structural heart disease

Discrimination transported

Composite discrimination held within
0.03 of the model's own benchmark

Component AUROC
0.679 to 0.837

Probabilities over-predict in both

All 11 components over-predicted risk in
both settings, a property of the model

Half of all components predict
0.35 to 0.40 whatever the prevalence

Composite output may be used as released; correct component probabilities before reading them as risk
A shift from the published training prevalences does this without local outcome data, for 10 of 11 components
